

TotalMD 2009 is Released

On June 30, 2009, TotalMD released the latest upgrade to its medical practice management software, TotalMD '09. This software release is packed full of features which include: an interactive ledger screen, UB04 capability, claim/statement tracking, ledger notes, auto line-item payments as well as many other new features and enhancements (click here to see new features for 2009). As a companion product, the all new TotalMD '09 Appointment Book Pro Module was released on the same day. This advanced scheduler gives customers the capability to e-mail appointment reminders to patients, view an entire week's or month's schedule on one screen and create appointment templates to designate time blocks. In addition to these new products, TotalMD continues to offer direct e-claim modules as well as the capability to link to electronic medical records systems, including: SpringCharts®, SOAPware® and PRAXIS®.

Surprisingly, TotalMD's prices continue to be a fraction of what you would expect for such a feature rich system. For example, medical offices can choose a \$99 single computer version or choose the \$3,995 Network Bundle which includes a year of support, interactive training CDs and the new Appointment Book Pro Module. Or, for just \$99 per month per user, medical offices can choose the web version of the software which allows complete data access from any location. In addition, all version of TotalMD continue to include free data conversions form Medisoft® and Lytec®. Lee J. Varney, Co-Founder of TotalMD explains, "Beyond providing medical offices with an easy-to-use full featured program, we believe that medical software does not need to be so expensive. Nearly every other industry has great software at an affordable price, and it seems unfair that professional software in the medical market is priced so high. TotalMD aims to bring reasonable pricing back to the medical software market."

About TotalMD

TotalMD offers medical practice management software as well as dental software, digital imaging software and x-ray sensors.
